There are many examples of pollinators and what they do for us.

Here are a few facts I know about pollinators. Flowers that bloom at night are often pale in color. Flowers that rely on daytime pollinators are often brightly colored. Another fact is the number of pollinators in an area is a great indicator of the overall health of the ecosystem. Where would we be without pollinators and what would it be like?

There are many different types of pollinators in nature. Here are some pollinators: bees, hummingbirds, bats, butterflies, and even water. In the United States, pollination produces nearly 20 billion dollars worth of products. Here is another fact: all the world's chocolate is pollinated by flies. Here is the third fact: approximately 1000 species of all pollinators are vertebrates.

There are a lot of things we would not have without pollinators. Most pollinators are beneficial insects. If we did not have pollinators we would not have some stuff like chocolate, honey and coffee. Where would we be without pollinators?
